Learning and Memory

How learning happens

Learning connects new ideas to prior knowledge.

Explaining a concept reveals gaps in understanding.

Active recall helps us discover what is missing.

Try to describe the idea in your own words.

Long-term memory and practice

Spread practice over several days instead of one.

Each attempt to recall strengthens the memory.

Make highlights, excerpts, and notes as you read.

Learning and Memory

Retrieval practice

Close the book and summarize the main ideas.

Return to the text to check what you could not recall.

Compare the original with a translation to clarify terms.

Transfer and application

Apply knowledge to a situation you have not seen before.

Find an example and a counterexample for a claim.

Organize the relationships between ideas in a mind map.

Learning and Memory

Spaced repetition

Schedule the next review so memory grows over time.

Allow the learning plan to change with feedback.

Reflection

Which ideas have changed your understanding?

Which questions deserve further study?

Write those questions in the margin and return later.
